

New text-to-speech module : Nexus vox

A truly remarkable pair of chips power up the Nexus vox. These chipsets translate plain English text into speech in real time with complete dynamic control of the voice characteristics.

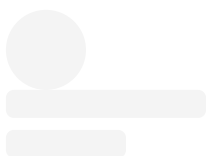

The TTS processor utilizes RC Systems' DoubleTalk TTS technology, based on a patented voice concatenation technique using actual human voice samples.

Voice control parameters, such as speed, volume, tone, pitch, and expression, can also be embedded within the text stream for dynamic, on-the-fly voice control.

There is even a real-time reverb effect!

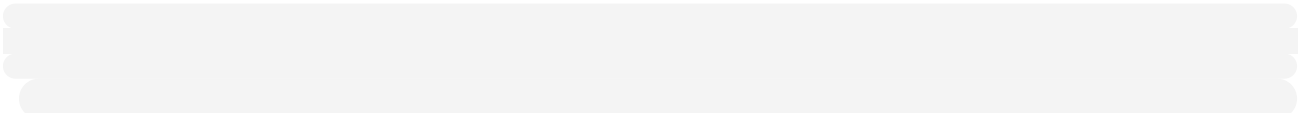

A serious competitor for the [Vax vox](#) module!

Say tuned for more demos...
